

THERMO-STAR COMPOSTER

Composting all year round and fast – Installation manual and composting tips

The Thermo-Star can be assembled very easily and quickly without tools. The side panels are assembled with connection rods, done! This is simple and very easy. Before you build and fill the composter you are looking for a suitable location. When choosing a location, ensure that your composter is easy to access from the house and garden. Think of your neighbors and install it at least 0.5 m away from their property.

Tips:

- Put the composter on a flat surface
- Contact with the ground is important (microorganisms)
- We recommend to loosen the soil first
- Do not put the composter on asphalt or concrete surfaces
- Sunny or partly shadow position
- Wind-protected, but not windless position
- The Thermo King floor grid (accessory) provides protection against rodents

What to put in your composter: Fruit and vegetable matter, coffee and tea grounds, eggshells (crushed), potted plants, cut flowers, used potting soil.

What must not be put in your composter: Meat and meat products, fish, leftovers, bread, cheese rind, bones, sick plant parts, ashes from coal and barbecue coal, cigarettes, vacuum cleaner bags, street rubbish.

Tip: Wet materials should be mixed with dry ones and coarse materials with fine ones. Ensure for the ventilation of the composters. Ensure that the compost is damp but not too wet.

We wish you much success and good composting results!
